

What is claimed is:

1. A device for dissecting an object, comprising:
a handle, and
an incision knife module, formed by at least one set of crossing blades.
2. The device according to claim 1, wherein the material of said handle comprises alloy, metal, glass, ceramics or plastic.
3. The device according to claim 2, wherein said alloy is stainless steel.
4. The device according to claim 1, wherein the material of said incision knife module's blade comprises alloy, metal, glass or ceramics.
5. The device according to claim 4, wherein said alloy is stainless steel.
6. The device according to claim 1, wherein said incision knife module has width ranging from 0.1mm to 10mm and depth ranging from 10 μ m to 1 cm.
7. The device according to claim 1, wherein said blade has a thickness ranging from 1 μ m to 100 μ m.
8. The device according to claim 1, wherein said incision knife module and handle are connected.
9. The device according to claim 1, wherein said device is sterilized.
10. The device according to claim 1, wherein said object is a cell colony.
11. A device for dissecting device for cutting an object, comprises:
a handle;
a pair of connection apparatuses, coupled with both sides of one end of the handle;
an elastic apparatus, coupled with lower side of one end of the handle; and
an incision knife module, coupled between the pair of connection apparatuses,
wherein said incision knife module comprises at least one knife, and one end of the knife is configured with blades, and the other end of the knife is neighbored

to one end of the handle, and facing toward the elastic apparatus.

12. The device according to claim 11, wherein the pair of connection apparatuses are integrally formed with the handle.

13. The device according to claim 11, wherein the pair of connection apparatuses are coupled at both sides of one end of the handle with at least one fixing device.

14. The device according to claim 11, wherein the blades are integrally formed with one end of the knife.

15. The device according to claim 11, wherein the blades are coupled with one end of the knife through a shaft, and the blades are of roller type.

16. The device according to claim 11, wherein the incision knife module is coupled between the pair of connection apparatuses through a fixing apparatus, and is deflectable with the fixing apparatus as the axis, and is limited with the deflected displacement through another fixing apparatus.

17. The device according to claim 11, wherein the elastic apparatus is integrally formed with the handle.

18. The device according to claim 11, wherein the elastic apparatus is coupled at the lower side of one end of the handle through at least one fixing apparatus.

19. The device according to claim 11, wherein the elastic apparatus is extended with at least one leaf spring which can be independently forced and deformed, and the leaf spring is carried with only one corresponding blade.

20. The device according to claim 11, wherein said object is a cell colony.
